

## Using IS with IS-Light

*Take a quick look to make sure that it is the “bigger” stone. Show the customer how to hold it and then pass it the customer. Observe and guide the customer, making sure he/she is doing it correctly so that they do not drop the stones out. You may ask them to put the scope closer to their eyes for a better view.*

*Sit the diamond in one of the two holes. Place the calibration CZ in the other hole.*

*Centre the Ideal-Scope over one of the stones. Move the scope from Side to side and only look at one stone at a time.*

*Using the **Ideal-Light** and **Tweezers***
