What Smart AnyCut Brings To You ?

- Generates **photoreal** images under various lighting environment for allocated solutions, to help select most promising solution.
- Generates **Optical symmetry** and **Brightness index** for allocated solutions.
- Helps **share** this data and performance indices with sales team, and receive their **confirmation** for the plan.
- Makes it possible for the sales team to take opinion of prospective buyer and help them choose a diamond cut of his/her choice from multiple solutions the rough offers (**a-la-carte diamond** cut)
- Reduces dependency on expert polisher, so as to achieve **consistent result** every time, fulfilling client's expectations.
- Finds out different parameters fetching required grade / look, thereby exploiting the rough to **maximize weight** recovery.
- Helps **avoid recutting** the stone, reducing value loss, as well as labour loss for polisher.

Salient Features:

Helium Polish Carbon has now got an option to add the new **Smart AnyCut (Fancy shape Asymmetric Smart Recut)** which optimizes Generic Fancies and Custom Cuts (your own designed cuts).

- Optimizes rough, semi-polished & pre-polished diamonds based on buyer's requirement of **customized parameters** and variation limits.
- Allocates based on **self-created grid**, to ensure desired performance and diamond appearance.
- Estimates **optical symmetry and brightness index** for all proposed solutions.
- Provides **photoreal** image for all solutions under various lighting environment.
- Uses **Smart Zoom** to push the weight limit at critical size break.
- Gives innumerable options to choose from-
 - Weight
 - Shape appeal
 - Optical Performance
 - Optical Symmetry
 - FaceUp Spread
